

VRS Vertical Rescue System

The VRS is designed for the rescue of one person by another individual unassisted. The VRS is for use on a person who has had a fall arrested and is left hanging on a lanyard, webbing or wire rope line. The faller may be raised or lowered to a safe position. When the faller is raised the rescuer has a 4:1 mechanical advantage, which reduces the effort required. The upper pulley wheels lock when the faller is being lowered.

This increased friction allows the rescuer to lower the faller effortlessly. A rescue pole is used to 'fish' for the fallers' harness attachment point. The rescue pole is sturdy and adjustable. The rescue karabiner has a large opening which assists with locating the attachment point. The VRS may be attached to front or rear attachment point on a harness.

Product Code:
VRS

Rope:
11mm - EN1891-A

Pulleys:
Aluminium - EN12278

Working Length:
15m
